

Idea #1: Birdwatcher

Input a location and view all of the birds native to that area along with a picture and song. You can also view notable/rare bird sightings nearby, or sightings for a particular species. Users can sign in with OAuth to keep track of their bird sightings for different regions/countries. Bird location information will be retrieved using the eBird API. Bird recordings will be retrieved using the xeno-canto API. Photos will be retrieved using the Pexels API.

Idea #2: Health and Meditation app

- Search for types of diets and recipes to promote a healthy lifestyle (have descriptions of all diets and a few good recipes for different types of eating lifestyles: vegan, vegetarian, etc...)
- Self timed/guided meditation
- Meditation music from a free music library (different categories, example : 7 day of calm)
- The API for Calm (meditation app can be gotten through log in)
- Make an account and sign in to their own account with OAuth
